

## ON SITE, SAFETY & ACCESS

# Piezo delivery

Sievert has launched a new torch designed for welding roof membranes or sheet metal work, which offers the convenience and safety of automatic piezo ignition.

The new Promatic torch is compatible with the full range of Sievert burners for all types of work, although it is particularly suited to the new range of Sievert lightweight titanium burners.

Some of its features include: an ergonomic handle in double-moulded composite material for high comfort and ease of use; a windshield that totally encases the flame; a locking device to keep the flame burning; and a precise valve in the handle to

achieve the right heat for the copper bit.

Chris Harper, business development manager at Sievert, UK, said: "When working on roofing contracts, exposed to all the elements, the last thing a roofer needs is a temperamental torch that is difficult to light."

"Our new Promatic torch has been produced following research into the working practices of roofers. We know it will improve their efficiency and enjoyment of their work," paying for itself in three months."

# On the pipeline

The UK-manufactured Roodsafe Fall Arrest system was specified to provide a safe working environment on an overground pipe system in Canada that spans 14.9 miles, transporting pump water to electricity generating stations.

The system was installed by Roodsafe's main Canadian distributor, Les Equipements JPS, which faced strong competition from several other

fall arrest system manufacturers.

This installation constitutes the largest Roodsafe system in the world, and the company speculates that it may even be the largest single fall arrest system in the world.

Similar projects elsewhere are now in the planning stages, with Roodsafe again specified for the safety systems.
